

### Chemistry Unit 3: Chemistry in action

1.1	<ul style="list-style-type: none"> <li>What is the difference between <b>quantitative</b> and <b>qualitative</b> chemical analysis? (2)</li> </ul>	<ul style="list-style-type: none"> <li><b>Qualitative</b> only tells you which chemical is present (1) <b>Quantitative</b> tells you how much of the chemical is present (the quantity) (1)</li> </ul>
1.2	<ul style="list-style-type: none"> <li>Explain why the test for any <b>ion</b> must be unique (1)</li> </ul>	<ul style="list-style-type: none"> <li>To avoid confusion between results and to allow one chemical to be clearly identified (1)</li> </ul>
1.3	<p>Describe the test for the following <b>ions</b> in solids or solution:</p> <p>a) <b>Aluminium ion, <math>Al^{3+}</math></b> (1)</p> <p>b) <b>Calcium ion, <math>Ca^{2+}</math></b> (1)</p> <p>c) <b>Copper, <math>Cu^{2+}</math></b> (1)</p> <p>d) <b>Iron, (ii) <math>Fe^{2+}</math></b> (1)</p> <p>e) <b>Iron (iii), <math>Fe^{3+}</math></b> (1)</p> <p>f) <b>Ammonium <math>NH_4^+</math></b> (1)</p>	<p>a) Add <b>sodium hydroxide</b> solution, a <b>white precipitate</b> forms, when excess sodium hydroxide is added the precipitate disappears. (1)</p> <p>b) Add <b>sodium hydroxide</b> solution, a <b>white precipitate</b> forms. (1)</p> <p>c) Add <b>sodium hydroxide</b> solution, a <b>blue precipitate</b> forms. (1)</p> <p>d) Add <b>sodium hydroxide</b> solution, a <b>green precipitate</b> forms. (1)</p> <p>e) Add <b>sodium hydroxide</b> solution, a <b>brown precipitate</b> forms. (1)</p> <p>f) Add <b>sodium hydroxide</b> solution, warm over a Bunsen flame (1) the gas given off turns damp <b>red litmus</b> paper blue (1)</p>
1.4	<p>Describe the test for the halide ions:</p> <p>a) <b>Chloride, <math>Cl^-</math></b> (1)</p> <p>b) <b>Bromide, <math>Br^-</math></b> (1)</p> <p>c) <b>Iodide, <math>I^-</math></b> (1)</p> <p>You also need to know the tests from unit 2; flame tests for Sodium <math>Na^+</math>, Potassium <math>K^+</math>, Calcium <math>Ca^{2+}</math>, Copper <math>Cu^{2+}</math>. Also tests for sulfate <math>SO_4^{2-}</math> and carbonate <math>CO_3^{2-}</math> ions.</p>	<p>a) Add <b>silver nitrate</b> solution and <b>nitric acid</b>, a white <b>precipitate</b> is formed. (1)</p> <p>b) Add <b>silver nitrate</b> solution and <b>nitric acid</b>, a cream <b>precipitate</b> is formed. (1)</p> <p>c) Add <b>silver nitrate</b> solution and <b>nitric acid</b>, a yellow <b>precipitate</b> is formed. (1)</p> <p>Flame tests; <math>Na^+</math> yellow, <math>K^+</math> lilac <math>Ca^{2+}</math> red, <math>Cu^{2+}</math> blue- green. Sulfate- barium chloride and hydrochloric acid = white precipitate. Carbonate, add any acid, fizzes giving off carbon dioxide that turns lime water cloudy.</p>
1.5	<p>Give two examples of where these tests for <b>ions</b> are used (2)</p>	<p>To test the <b>purity</b> of drinking water (1), to identify chemicals present in blood (1)</p>

2.1	<p>Calculate the <b>concentration</b> of a solution in <b>g/dm<sup>3</sup></b>.</p> <p>a) 20g dissolved in 100cm<sup>3</sup> of water <b>(1)</b></p> <p>b) 0.5g dissolved in 100cm<sup>3</sup> of water <b>(1)</b></p> <p>c) 0.2g dissolved in 50cm<sup>3</sup> of water <b>(1)</b></p>	<p>First convert <b>cm<sup>3</sup></b> into <b>dm<sup>3</sup></b>, then: Concentration = mass/ volume in <b>dm<sup>3</sup></b></p> <p>a) <math>100/1000 = 0.1\text{dm}^3</math>, <math>20/0.1 = 200\text{g dm}^{-3}</math></p> <p>b) <math>100/1000 = 0.1\text{dm}^3</math>, <math>0.5/0.1 = 5\text{g dm}^{-3}</math></p> <p>c) <math>50/1000 = 0.05\text{dm}^3</math>, <math>0.2/0.05 = 4\text{g dm}^{-3}</math></p>
2.6 Higher	Describe how to calculate the <b>mass of solute in a solution</b>	Measure mass of solution <b>(1)</b> , heat solution gently in an <b>evaporating basin</b> until it is dry <b>(1)</b> allow to cool and measure mass of solid residue <b>(1)</b> , divide mass of <b>residue</b> by mass of solute <b>(1)</b>
2.7 Higher	a) Recall 3 units for measuring <b>concentration</b> . <b>(1)</b>	a) Grams per deci metre cubed, <b>g dm<sup>-3</sup> (1)</b> , moles per deci metre cubed <b>mol dm<sup>-3</sup> (1)</b> , number of particles per deci metre cubed <b>(1)</b>
2.8 Higher	<p>Convert the <b>mass</b> of a chemical into the <b>number of moles</b> of a chemical.</p> <p>a) 20g of calcium (Ar for Ca = 40)</p> <p>b) 200g of CaCO<sub>3</sub> (Ar of Ca = 40, C = 12, O = 16)</p> <p>c) 5g of CuSO<sub>4</sub> (Ar of Cu = 63.5, S = 32, O = 16)</p>	<p><b>Number of moles = mass (g)/ Mr or Ar (Mr is the relative mass of a formula, Ar is the relative atomic mass of an element.)</b></p> <p>a) <math>20/40 = 0.5</math> moles</p> <p>b) Mr of = <math>40 + 12 + (3 \times 16) = 100</math> moles = <math>200/100 = 2</math></p> <p>c) Mr of = <math>63.5 + 32 + (4 \times 16) = 159.5</math> moles = <math>5/159.5</math></p>
2.9 Higher	<p>Convert <b>concentration</b> in <b>g dm<sup>-3</sup></b> into <b>mol dm<sup>-3</sup></b></p> <p>a) 20g dm<sup>-3</sup> of calcium hydroxide Ca(OH)<sub>2</sub> (Ca =40, o =16, H = 1)</p> <p>b) 282g of sodium carbonate Na<sub>2</sub>CO<sub>3</sub> (Na =23, C=12, O=16)</p> <p>Convert concentration in <b>mol dm<sup>-3</sup></b> into <b>g dm<sup>-3</sup></b></p> <p>c) 0.5 mol dm<sup>-3</sup> of methane CH<sub>4</sub> (C=12, H=1)</p> <p>d) 2 mol dm<sup>-3</sup> of sulphuric acid H<sub>2</sub>SO<sub>4</sub> (H=1, S = 32, O =16)</p>	<p><b>Number of moles = mass (g)/ Mr or Ar</b></p> <p>a) Mr of Ca(OH)<sub>2</sub> = <math>40 + 2(1+16) = 74</math> moles = mass/Mr = <math>20/74 = 0.27 \text{ mol dm}^{-3}</math></p> <p>b) Mr of Na<sub>2</sub>CO<sub>3</sub> = <math>(2 \times 23) + 12 + (3 \times 16) = 106</math> moles = mass/Mr = <math>282/106 = 2.66 \text{ mol dm}^{-3}</math></p> <p>mass in grams = No. of moles X Mr or Ar</p> <p>c) Mr of CH<sub>4</sub> = <math>12 + (4 \times 1) = 16</math> mass = <math>0.5 \times 16 = 8 \text{ g}</math> of methane CH<sub>4</sub> g dm<sup>-3</sup></p> <p>d) Mr of H<sub>2</sub>SO<sub>4</sub> = <math>1 \times 2 + 32 + (4 \times 16) = 98</math> mass = <math>2 \times 98 = 196 \text{ g dm}^{-3}</math></p>
2.10	Describe how to prepare a <b>soluble salt</b> from an acid and an	Add excess solid <b>reactant</b> (to ensure all the acid is used up) <b>(1)</b> , filter to remove

	<b>insoluble reactant (3)</b>	unreacted solid reactant(1), the remaining solution is the new salt and water (1)
2.11	Describe how to prepare a <b>soluble salt</b> from an acid and a <b>soluble reactant (3)</b>	<b>Titration</b> is used to work out the exact <b>volume</b> of <b>reactant</b> needed to react with the acid (1), the exact volume of acid and reactant are added together (1), the remaining solution is the new <b>salt</b> and <b>water (1)</b>
2.12	a) Name the two <b>ions</b> involved in an <b>acid - base titration reaction (2)</b> b) Describe what happens to the <b>ions</b> in an acid base <b>titration reaction (1)</b>	a) <b>hydrogen ions, H<sup>+</sup> (1) and hydroxide ions, OH<sup>-</sup> (1)</b> b) The <b>hydrogen ions</b> are <b>neutralised</b> by the <b>hydroxide ions (1)</b> water H <sub>2</sub> O is formed (1)
2.13	Describe how to carry out an acid - base <b>titration</b> , include names and uses of equipment (6)	Fill a <b>burette</b> with acid (1), use a <b>pipette</b> to measure a set volume (eg 20cm <sup>3</sup> ) of alkali (of known concentration) and add to a <b>conical flask (1)</b> , add a few drops of an <b>indicator</b> , like phenolphthalein (pink in alkali and colourless in acid) or methyl orange (yellow in alkali and red in acid) (1) place a white tile underneath the conical flask (1), add the acid and swirl the flask, keep going until the indicator changes colour(1) <b>repeat</b> to test reliability(1)
2.15 Higher	For the <b>neutralisation</b> reaction: $HCl + NaOH \rightarrow NaCl + H_2O$ Calculate the <b>concentration</b> of acid in the following examples. a) 20cm <sup>3</sup> of 0.5M alkali is neutralised by 24cm <sup>3</sup> of acid.(3)  b) 25cm <sup>3</sup> of 2M alkali is neutralised by 15cm <sup>3</sup> of acid.(3)	a) <b>Convert cm<sup>3</sup> into dm<sup>3</sup> by dividing by 1000.</b> Vol of alkali = 20/1000 = 0.02dm <sup>3</sup> Vol of acid = 24/1000 = 0.024dm <sup>3</sup> (1) Calc no moles of alkali in 0.02dm <sup>3</sup> of solution. <b>No of moles = conc X vol</b> = 0.5 X 0.02 = 0.01 mol (1) The equation shows a ratio of 1:1 for the number of moles of acid and alkali, so there must be 0.01 mols of acid in 0.024dm <sup>3</sup> of solution. <b>Conc = no moles/ volume</b> = 0.01 / 0.024 = 0.42 mol dm <sup>3</sup> (1)  b) <b>Convert cm<sup>3</sup> into dm<sup>3</sup> by dividing by 1000.</b> Vol of alkali = 25/1000 = 0.025dm <sup>3</sup> Vol of acid = 15/1000 = 0.015dm <sup>3</sup> (1) <b>No of moles = conc X vol</b>

		$= 2 \times 0.025$ $= 0.05 \text{ mol} \quad (1)$ <p>The equation shows a ratio of 1:1 for the number of moles of acid and alkali, so there must be 0.05 mols of acid in 0.015dm<sup>3</sup> of solution.</p> <p>Conc of acid = no moles/ volume</p> $= 0.05 / 0.015$ $= 3.33 \text{ mol dm}^3 \quad (1)$
3.1	Describe what an <b>electrolyte</b> is (1)	An <b>ionic</b> substance in the <b>molten</b> state (melted) or as a <b>solution</b> (1)
3.2	a) What name is given to positively charged ions? (1) b) What name is given to negatively ions? (1) c) Describe the movement of positive ions during <b>electrolysis</b> (2)	a) <b>Cations</b> (1) b) <b>Anions</b> (1) c) Positively charged <b>cations</b> attract to the negatively charged <b>cathode</b> (1). Negatively charged <b>anions</b> attract to the positively charged <b>anode</b> (1)
3.3	a) Define <b>oxidation</b> (1) b) Define <b>reduction</b> (1)	loss of electrons (1) Gain of electrons (1) <b>(OIL- oxidation is loss of electrons. RIG- reduction is gain of electrons)</b>
3.4	a) Name the <b>electrode</b> where <b>reduction</b> takes place- and explain why (2) b) Name the <b>electrode</b> where <b>oxidation</b> takes place- and explain why (2)	a) <b>Cathode</b> (1) as positive <b>cations</b> are <b>discharged</b> by gaining <b>electrons</b> at the negative <b>cathode</b> (1) b) <b>Anode</b> (1) as negative <b>anions</b> are <b>discharged</b> by losing <b>electrons</b> at the positive <b>anode</b> (1)
3.5 Higher	Write <b>ionic half equations</b> for the reactions at the <b>electrodes</b> in the following <b>electrolysis cells</b> : a) <b>Molten</b> sodium chloride NaCl (l) (2) b) <b>Aqueous</b> sodium chloride NaCl (aq) (2) c) <b>Molten</b> lead bromide PbBr (l) (2) d) <b>Aqueous</b> copper sulfate CuSO <sub>4</sub> (aq) (2)	a) Anode: $\text{Na}^+ + e^- \rightarrow \text{Na}$ (1) Cathode: $2\text{Cl}^- \rightarrow \text{Cl}_2 + 2e^-$ (1) b) Anode: $2\text{H}^+ + 2e^- \rightarrow \text{H}_2$ (1) Cathode: $2\text{Cl}^- \rightarrow \text{Cl}_2 + 2e^-$ (1) c) Anode: $\text{Pb}^{2+} + 2e^- \rightarrow \text{Pb}$ (1) Cathode: $2\text{Br}^- \rightarrow \text{Br}_2 + 2e^-$ (1) d) Anode: $\text{Cu}^{2+} + 2e^- \rightarrow \text{Cu}$ (1) Cathode: $4\text{OH}^- \rightarrow 2\text{H}_2\text{O} + \text{O}_2 + 4e^-$ (1)
3.6	Describe how <b>sodium</b> is manufactured	<b>Electrolysis of molten sodium chloride</b> (1)
3.7	Name two uses for sodium (2)	Street lights (1), coolant in some nuclear reactors (1)
3.8	Name the products formed during the <b>electrolysis</b> of <b>aqueous</b> sodium	Hydrogen gas (at cathode) (1), chlorine gas (at anode) (1), and sodium hydroxide solution

	chloride (3)	(1)
3.9	Explain why these products are formed (4)	Both sodium and hydrogen <b>cations</b> attract to the <b>cathode (1)</b> , the <b>least reactive ion</b> - hydrogen is <b>discharged</b> forming hydrogen gas.(1) Both hydroxide and chloride <b>anions</b> are attracted to the <b>anode (1)</b> . Chloride ion is <b>discharged</b> forming chlorine gas (1). Sodium and hydroxide ions are left in solution as sodium hydroxide (1).
3.10	a) Recall the rules that determine which <b>cation</b> is <b>reduced</b> at the <b>cathode (1)</b> . b) Recall the rules that determine which <b>anion</b> is <b>oxidised</b> at the <b>anode (1)</b> .	a) The least reactive <b>cation</b> is <b>discharged</b> and <b>reduced</b> - gains electron/s (1). (most-least reactive Na <sup>+</sup> , Cu <sup>+</sup> , H <sup>+</sup> ) b) The order for discharge goes -halide ions (forms halogen gas), hydroxide ion (forms oxygen gas and water), sulfate ions (1).
3.12	a) Explain the change in mass of the copper electrodes during the electrolysis of copper sulphate (1). b) Describe how copper is <b>purified</b> and explain what happens at each copper electrode. (6)  c) Why is pure copper needed? (1)	The <b>anode</b> decreases in mass and the <b>cathode</b> increases in mass. (1) b) Impure copper as the anode & pure copper as cathode (1), electrolyte is copper sulfate (1). A direct current is passed through the electrodes (1),copper atoms in the anode are oxidised to copper ions by losing 2 electrons (1) copper cations in electrolyte are attracted to the cathode(1), they're reduced to copper atoms by gaining 2 electrons (1) c) Pure copper is a better <b>conductor</b> of electricity & in high demand (1)
3.14	a) Explain how a metal is <b>electroplated (4)</b>  b) Describe two uses for electroplating metals (2)	a) The item to be plated is connected as the <b>cathode (1)</b> , the <b>electrolyte</b> contains ions of the metal to be plated - eg gold, silver or zinc (1). A direct current is passed through the cell (1). A layer of metal builds up on the cathode (1) b) Gold plated jewellery, stays looking good, but is lower in cost (1). Galvanising-covering in zinc reduces corrosion. (1)
4.1 Higher	Recall the volume occupied by 1 mole of any gas at standard temperature and pressure. (1)	24dm <sup>3</sup> (1) standard temperature and pressure (room temp. and 1 atm. pressure)
4.2 Higher	a) Use the <b>balanced equation</b> below to work out the volume of oxygen gas needed to react	a) The equation shows ratio of hydrogen to oxygen is 2:1, so 2 moles of hydrogen react with 1 mole of oxygen. <b>No. moles of gas = volume of gas/24</b>

	<p>completely with <math>12\text{dm}^3</math> of hydrogen gas. (2)</p> <p><math>2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}</math></p> <p>b) Calculate the volume taken up by 11g of carbon dioxide (Ar of C = 12, O = 16) (2)</p>	<p>No. moles of <math>\text{H}_2 = 12/24 = 0.5</math> (1)</p> <p>0.5 mol of <math>\text{H}_2</math> reacts with 0.25 mol of <math>\text{O}_2</math>.</p> <p><b>Volume of gas = No moles X 24</b></p> <p><math>= 0.25 \times 24 = 6\text{dm}^3</math> (1)</p> <p>b) Mr of <math>\text{CO}_2 = 12 + (2 \times 16) = 44</math></p> <p><b>No moles = mass in g/ Mr</b></p> <p><math>= 11/44 = 0.25</math> (1)</p> <p><b>Volume of gas = No moles X 24</b></p> <p><math>= 0.25 \times 24 = 6\text{dm}^3</math> (1)</p>
4.4	What is the main use of <b>ammonia</b> ? (1)	As a <b>fertiliser</b> promoting plant growth (due to high nitrogen content) (1)
4.5	<p>a) What environmental problem is caused by the over use of <b>fertilisers</b>? (1)</p> <p>b) Explain how the <b>fertilisers</b> cause this problem (4)</p>	<p>a) <b>Eutrophication</b> (1)</p> <p>b) <b>Fertiliser</b> washes into lakes and streams (1), <b>algae</b> grows quickly blocking sunlight reaching plants below the surface (1), plants under water die (as can't <b>photosynthesise</b>), <b>bacteria decompose</b> plant material and use up <b>oxygen</b> in water during <b>respiration</b> (1), fish and other aquatic <b>suffocate</b> due to lack of oxygen in water (1)</p>
4.6	<p>a) What is meant by a <b>reversible</b> reaction? (1)</p> <p>b) Write the symbol for a reversible reaction (1)</p> <p>c) Write the word equation for the production of ammonia (1)</p> <p>d) Write a <b>balanced symbol equation</b> for the production of ammonia (1)</p> <p>e) Where do the <b>reactants</b> to make <b>ammonia</b> come from? (2)</p>	<p>a) A reaction where the reactants react to form products, but also the products break down to form the reactants again (1)</p> <p>b) <math>\rightleftharpoons</math> (1)</p> <p>c) Nitrogen + hydrogen <math>\rightleftharpoons</math> ammonia (1)</p> <p>d) <math>\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3</math> (1)</p> <p>e) Nitrogen comes from the air (remember 78% of air is nitrogen) (1). Hydrogen comes from natural gas- methane (1)</p>
4.7 Higher	Explain what is meant by <b>dynamic equilibrium</b> (2)	A <b>reversible</b> reaction where the forward reaction takes place at the exact same rate as the reverse reaction. (1) Overall there is no change in the ratio of reactants to products. (1)
4.8 Higher	a) How does an increase in temperature affect the <b>equilibrium position</b> of the reversible reaction below where the forward reaction is	a) Increase in temperature favours an <b>endothermic</b> reaction (1), as the forward reaction is <b>exothermic</b> the reverse reaction must be <b>endothermic</b> (1). The reverse reaction is <b>favoured</b> and <b>equilibrium shifts</b> to the left, reducing the <b>yield</b> of product

	<p>exothermic? (3)</p> $\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3$ <p>b) How does an increase in pressure affect the <b>equilibrium position</b> of the above reaction? (3)</p>	<p>(ammonia). (1)</p> <p>b) An increase in pressure favours a reduction in pressure (1) caused by a reduction in the number of gas molecules. (1) There are 4 molecules on the left and 2 on the right of the equation, so the forward reaction reduces pressure and so the <b>equilibrium position</b> moves to the right, increasing the <b>yield</b> of ammonia (1)</p>
4.9 Higher	<p>a) Recall how an increase in pressure affects the <b>rate of a reaction</b> (1)</p> <p>b) Recall how an increase in temperature affects the rate of a reaction (1)</p> <p>c) Recall how a catalyst affects the rate of a reaction (1)</p> <p>(Note these conditions increase the speed of a reaction, but may reduce the yield- often a compromise of conditions is needed.)</p>	<p>a) Increase in pressure increases the reaction rate (1) (more particles in same volume, <b>increases frequency of successful collisions</b>)</p> <p>b) Increase in temperature increases the rate of reaction (1) (particles have more <b>energy</b>, move faster, <b>increases frequency of successful collisions</b>)</p> <p>c) Catalyst speeds up reaction rate by <b>lowering the activation energy</b>- but is not used up in the reaction. (1)</p>
4.10 Higher	<p>Explain why the reaction conditions in the <b>Haber process</b> are set at 450°C, 200 atm and with an iron catalyst with a honeycomb structure (4)</p>	<p>Fast rate of reaction favoured by high temperature and pressure (1), but high yield favoured by low temperature and high pressure (1). Compromise of conditions to favour fast reaction rate and high yield. (1) Iron acts as a catalyst, honey comb increases it's surface area, both increase the rate of reaction.(1)</p>
5.1	<p>a) Describe the conditions needed to produce <b>ethanol</b> from plants (3)</p> <p>b) What name is given to this reaction? (1)</p> <p>c) Write a word equation for this reaction (1)</p> <p>d) Write a balanced symbol equation for the reaction (3)</p>	<p>a) Plants high in sugary carbohydrates are pulped and mixed with yeast(1), kept warm (1) and anaerobic (lacking in oxygen) (1).</p> <p>b) Fermentation reaction (1)</p> <p>c) Glucose → ethanol + carbon dioxide (1)</p> <p>d) <math>\text{C}_6\text{H}_{12}\text{O}_6 \rightarrow 2\text{C}_2\text{H}_5\text{OH} + 2\text{CO}_2</math> (3)</p>
5.2	<p>Describe how to prepare a solution of <b>ethanol</b> (4)</p>	<p>Sterilise a conical flask, add warm water (30-40°C) (1), sugar (or plant material-</p>

		maize, wheat, potatoes) (1), yeast, and leave for a few days(1), preventing oxygen getting to reaction mixture. (1)
5.3	Recall the approximate % of alcohol in the following drinks: a) Beer, lager, cider (1) b) Wine (1) c) Spirits like vodka & whiskey (1)	a) 3-5% (1) b) 9-13% (1) c) 40% (1)
5.4	a) Describe some problems caused by over use of alcoholic drinks (2) b) Give a use for <b>ethanol</b> (other than as a drink) (1)	Family break down, violence, liver cirrhosis, cancer of mouth, throat & stomach (1 mark per point) b) As a fuel, it can be used in place of petrol as it releases a lot of energy when burnt (1)
5.5	a) Name the technique used to purify ethanol from a solution. (1) b) Describe how the process works (3)	a) Fractional distillation (1) b) Heat solution to 78°C in a flask attached to a condenser (1), ethanol evaporates and vapour passes through condenser and cools, condensing to give liquid ethanol (1). Water doesn't boil until 100°C so is left behind in the flask. (1)
5.6	a) Describe another method used to produce ethanol (1) b) Write a word equation for the reaction (1) c) Write a balanced symbol equation for the reaction (2)	a) Reacting ethene (produced during cracking of crude oil fractions) with steam. (1) b) Ethene + steam → ethanol (1) c) $C_2H_4 + H_2O \rightarrow C_2H_5OH$ (2)
5.7 Higher	a) <b>Evaluate</b> when it is better to use <b>fermentation</b> to produce ethanol and when it is better to <b>react ethene with steam</b> (4) b) Describe two advantage of using <b>fermentation</b> to produce ethanol (1) c) Describe two disadvantage of using <b>fermentation</b> to produce ethanol (2)	a) Fermentation- best in countries which can't afford crude oil, (1) have a lot of land and suitable climate appropriate to grow crops eg sugar cane or sugar beet. (1) Reacting ethene with steam- best in countries that can afford crude oil (1), have limited land to grow crops for fuel. Need a pure product. (1) b) Produced from a renewable source (1), little energy needed to cause reaction. (1) c) Ethanol takes longer to be produced, as fermentation uses a batch process, (1)also ethanol produced is not as pure as in the faster, continuous ethene reaction, carbon

		dioxide is produced as a by product of the reaction (1)
5.8 Higher	a) Describe how <b>ethene</b> can be produced from <b>ethanol</b> (1) b) Write a <b>word equation</b> for the reaction (1) c) Write a <b>balanced symbol equation</b> for the reaction (2)	a) <b>Ethanol is dehydrated</b> (water is removed) by passing over a hot <b>catalyst</b> (1) b) $\text{ethanol} \rightarrow \text{ethene} + \text{water}$ (1) c) $\text{C}_2\text{H}_5\text{OH} \rightarrow \text{C}_2\text{H}_4 + \text{H}_2\text{O}$ (1)
5.9	Define the term <b>homologous series</b> (2)	A series of compounds which have the same <b>general formula</b> (1), have similar chemical properties and reactions, show a gradual change in physical properties- like boiling point (1)
5.10	Name the following molecules: a) $\text{CH}_4$ (1) b) $\text{C}_2\text{H}_6$ (1) c) $\text{C}_3\text{H}_8$ (1) d) $\text{C}_4\text{H}_{10}$ (1) e) $\text{C}_2\text{H}_4$ (1) f) $\text{C}_3\text{H}_6$ (1) g) $\text{CH}_3\text{OH}$ Higher only (1) h) $\text{C}_2\text{H}_5\text{OH}$ Higher only (1) i) $\text{C}_3\text{H}_7\text{OH}$ Higher only (1) j) $\text{COOH}$ Higher only (1) k) $\text{CH}_3\text{COOH}$ Higher only (1) l) $\text{C}_2\text{H}_5\text{COOH}$ Higher only (1)	a) Methane (1) b) Ethane (1) c) Propane (1) d) Butane (1) e) Ethene (1) f) Propene (1) g) Methanol (1) h) Ethanol (1) i) Propanol (1) j) Methanoic acid (1) k) Ethanoic acid (1) l) Propanoic acid (1)
5.11	Name the <b>homolgous series</b> that the following chemicals belong to: a) $\text{C}_3\text{H}_7\text{OH}$ (1) b). $\text{COOH}$ (1) c) $\text{C}_4\text{H}_{10}$ (1) d) $\text{C}_2\text{H}_4$ (1)	a) Alcohol (1) b) Carboxylic acid (1) c) Alkane (1) d) Alkene (1)
5.12	a) Name the product formed when <b>ethanol</b> is <b>oxidised</b> (1) b) Explain why wine goes off when exposed to the air (1)	a) Ethanoic acid (1) b) The ethanol in the wine is <b>oxidised</b> (reacts with oxygen in the air) to form <b>ethanoic acid</b> (more commonly know as vinegar) which has a distinctive sour taste (1)
5.13	Describe two uses of vinegar (2)	As a <b>preservative</b> (1) (eg pickled onions), as a <b>flavour</b> (1) (eg in salad dressing)

5.14	Describe the reaction of ethanoic acid with: a) Metals (1) b) Carbonates (1) c) Bases like oxides (1) d) Indicators (1)	a) Metal may fizz giving off hydrogen gas and producing a neutral salt (1) b) Carbonate may fizz, giving off carbon dioxide gas and producing a neutral salt c) Acid is neutralised (as in previous two reactions) forming water & neutral salt d) Universal indicator turns orange or red, pH 2-4. Blue litmus paper turns red
5.15	Complete the following word equations: a) Magnesium + ethanoic acid (1) b) Copper carbonate + ethanoic acid c) Calcium oxide + ethanoic acid (1)	a) → magnesium ethanoate + hydrogen b) → copper ethanoate + water + carbon dioxide c) → calcium ethanoate + water
5.16  Higher	a) Name the type of chemical produced when an alcohol reacts with a carboxylic acid (1) b) Name the chemicals produced when ethanol reacts with ethanoic acid (1) c) Writing a balanced symbol equation for this reaction. (2)	a) An <b>ester</b> (1) b) <b>ethyl ethanoate</b> and water (1) c) $CH_3COOH + C_2H_5OH \rightarrow CH_3COOC_2H_5 + H_2O$ (2)
5.17	Describe three uses for <b>esters</b> (3)	Flavours in foods as taste nice (1), perfumes as smell nice (1), used to make polyester plastic- used to make plastic bottles or as fibres for clothing. (1)
5.18	Name a use for recycled polyester	To make fleeces (1)
5.19	What type of chemical are oils and fats? (1)	Esters (1)
